Research track-record ([Researcher ID: L-4704-2016](https://orcid.org/0000-0001-9000-0001))

My Innsbruck theoretical physics group works in AMO physics with emphasis on quantum optics, fundamental quantum physics, ultracold quantum gases and quantum simulation. In the past decade we put forward foundational contributions of cavity cooling, ranging from ultra-cold gases, large molecules, nano-particles to opto-mechanics. Merging traditional quantum optics with ultra-cold gas physics we predicted and analysed new atom-field self-ordering phenomena and emerging exotic quantum phases as super solids, edge states and spin spiral phases.

Besides fundamental theoretical aspects of light-matter interaction I strongly target a wide range of experimental and practical quantum optics applications ranging from laser cooling of solids, heat gradient driven lasing and cooling, self-learning optimal light collection systems, super-radiant optical atomic clocks or cavity enhanced quantum simulation and simulated annealing.
